Identity of *Glycosmis aglaioides* Miao (Rutaceae)

MOU Feng-Juan^{1,2}, MA Shi-Zhu³, LI Shuang-Zhi¹, ZHANG Dian-Xiang^{2*}

(1. Key Laboratory for Forest Resources Conservation and Use in the Southwest Mountains of China, Ministry of Education, Southwest Forestry University, Kunming 650224, China; 2. South China Botanical Garden, Chinese Academy of Sciences, Guangzhou 510650, China; 3. Dali Institute of Forestry Science, Dali 671000, China)

Abstract: *Glycosmis aglaioides* Miao (Rutaceae) was described as a species endemic to Guizhou Province in China. The true identity of the species, however, is of *Walsura robusta* Roxb., a species of Meliaceae widespread in tropical Asia. It is thus reduced to synonymy of the latter.

Key words: *Glycosmis*; *G. aglaioides*; *Walsura*; *W. robusta*; synonym

米兰山小橘 (芸香科) 的分类订正

牟凤娟^{1,2}, 马士祝³, 李双智¹, 张奠湘^{2*}

(1. 西南林业大学 西南山地森林资源保育与利用省部共建教育部重点实验室, 昆明 650224; 2. 中国科学院 华南植物园, 广州 510650; 3. 大理林业科学研究所, 云南 大理 671000)

摘要: 对芸香科山小橘属米兰山小橘进行了分类订正, 根据模式标本查阅及原始文献相关特征描述, 该种属于楝科割舌树属已知种类, 将其处理为割舌树的异名。

关键词: 山小橘属; 米兰山小橘; 割舌树属; 割舌树; 异名

Chen (1997) recognized 3 species of *Walsura* Roxb. (Meliaceae) while Peng *et al.* (2010) revised 2 species in China. In revising the genus *Glycosmis* (Rutaceae), we found that one species long recognized as belonging to the Rutaceous genus *Glycosmis*, *G. aglaioides* Miao, was in fact conspecific with *Walsura robusta* Roxb. (Meliaceae), which widespread in tropical Asia. Thus a formal reduction of this name is proposed.

Walsura robusta Roxburgh, Hort. Beng. 32. 1814, nom. nud., et Fl. Ind., ed. 2, 2: 386. 1832. — *Surwala robusta* (Roxb.) M. Roem. Type: India; without precise locality, William Roxburgh s. n. (MO!)

Glycosmis aglaioides Miao in Acta Sci. Nat. Univ.

Sun. 32(4): 59-60. 1993, syn. nov. Type: China.

Guizhou (贵州): Anlong (安龙), Leigongtan (雷公滩), without precise time, G. S. Liao (廖国胜) Guizhou C1236 (holotype, SYS!; isotype, SYS!)

Glycosmis aglaioides Miao (Rutaceae) was described by Miao (1993), based on a collection, G. S. Liao Guizhou C1236, from Leigongtan, Anlong County, Guizhou Province. According to the original descriptions, leaves 14-15 cm; leaflets 5, opposite or sub-opposite, papery; petiolules 0.5-2 cm, both ends inflated, with joints; leaflet 5-9 × 1.9-3.6 cm, apex acuminate. Thyrses axillary, or sub-terminal, 1-2.2 cm, sparsely pubescent. Flowers 4-6 mm, pedicellate. Calyx short, outside pubescent. Petals white, oblong to elliptic, 2.5 mm, outside pubescent, apex acuminate to

图 1 A. 米兰山小橘的模式标本; B. 割舌树的模式标本。

Fig. 1 A. Holotype of *Glycosmis aglaioides* Miau; B. Holotype of *Walsura robusta* Roxb.

obtuse. Stamen filament 10, ovary obovate, 2-locular, apically covered with trichomes.

The two genera, *Glycosmis* (Rutaceae) and *Walsura* (Meliaceae) are difficult to be distinguished from each other, and misplacement of species into each other has happened before. One species first described as *Walsura xizangensis* (Wu *et al.*, 1980) has been transferred into *Glycosmis* as *G. xizangensis* (C. Y. Wu *et al.* H. Li) D. D. Tao (Rutaceae) later (Tao, 1994). *Glycosmis* is prominently characterized with new growth (including young buds and inflorescences) covered with dense ferruginous pubescence. Leaves alternate (rarely opposite), simple, 1-foliolate or 3–7 odd-pinnate. Inflorescences often compoundly racemose, or reduced to 1 or a few flowers. Stamens 8 or 10, distinct, alternately \pm unequal in length. Gynoecium 2–5-loculed (Corrêa, 1805; Swingle *et al.*, 1967; Huang, 1997; Zhang *et al.*, 2010). After a careful study of the type specimens of

Glycosmis aglaioides, we find that, leaflets 3 or 5, opposite or sub-opposite, both of leaves glabrous and lustrous; with conspicuous 6–9 lateral veins panicles axillary or terminal, branching in thyrses; filaments distinct or only basally connate. Examination of the holotype and isotype of *Glycosmis aglaioides* has confirmed that it is conspecific with *Walsura robusta* in Meliaceae. Therefore, we reduce *Glycosmis aglaioides* to synonymy of *Walsura robusta*. *W. robusta* is a species distributed widely in tropical Asia (China, India, Indo-China Peninsula, Malay Peninsula and Indonesia) in habitats under dense or sparse forest. In China, it has been recorded in Yunnan, Guangxi, Guangdong and Hainan provinces. With the reduction of *Glycosmis aglaioides* into its synonymy, it is also recorded in Guizhou Province now.

《东亚高等植物分类学文献概览》出版

由中国科学院上海辰山植物科学研究中心马金双博士所著的《东亚高等植物分类学文献概览》(The Outline of Taxonomic Literature of Eastern Asian Higher Plants)近日由高等教育出版社出版(精装本, 505页; ISBN: 978-7-04-032948-3; 定价: 89元)。本书集著者 20 多年的教学和科研总结, 详细介绍了东亚(中国、日本、朝鲜和韩国)及其周边国家与地区的高等植物分类学文献。全书共包括了四部分 10 大类 60 项近 1 200 种文献。其中第一部分是文献基础知识, 第二部分是文献介绍以及相关的评论, 包括检索类、辞典类、植物志、采集史、分类系统、命名法规、拉丁文与模式以及参考书, 第三部分是中外期刊介绍与评论, 第四部分为 18 个与分类学有关的附录。另外, 书末还有 6 个索引。

中国科学院植物研究所王文采院士、中国植物学会理事长、中国科学院植物研究所洪德元院士、中国科学院上海生命科学研究院院长陈晓亚院士分别为本书作序。

作为东亚首部高等植物分类学文献专著, 本书是从事东亚及其周边地区高等植物分类的必备工具书, 同时也是植物地理学、植物区系学、植物生态学、植物资源学、植物化学、植物保护生物学、生物多样性研究以及农业、林业、医药、园林、商业、检疫等专业的科研工作者和大专院校师生的重要工具书, 也可作为有关部门管理人员和植物学爱好者的参考书。详细参见目录与内容介绍(<http://www.metasequoia.org/eatl.pdf>)。

邮购: 优惠价每本 80 元(含印刷品挂号邮资); 10 本以上可另行优惠。

四川省藓类植物新记录

李祖凰¹, 曹同^{1*}, 于晶¹, 孙守琴²

(1. 上海师范大学生命与环境科学学院, 上海 200234; 2. 中国科学院山地灾害与环境研究所, 成都 610041)

摘要: 在对四川省第一高峰贡嘎山的野外调查和 1 000 余份采集标本鉴定的基础上, 现已知贡嘎山有藓类植物 40 科, 133 属, 321 种。其中, 隶属于 10 科, 12 属的 12 种为四川省苔藓植物新记录种。该文就新记录种进行详细报道, 为中国和四川省的苔藓植物区系研究提供新的资料。

关键词: 藓类植物; 四川省; 贡嘎山; 新记录

Sichuan Province, in China's western hinterland, covers most of the Sichuan Basin and is surrounded by mountains. It is gifted with lush mountains and exquisite waters, and abounds in historical and cultural resources. Sichuan is known as the "land of abundance, the heaven of animals and plants". Sichuan also is one of provinces with the richest biodiversity of mosses in China. Based on literature survey before 1996, Redfearn *et al.* in a newly updated and annotated checklist of Chinese mosses listed 649 species belonging to 224 genera and 53 families of mosses from Sichuan (Redfearn *et al.*, 1996). Since then, the publication of *Flora Bryophytorum Sinicorum* volumes 1-4, 6-8 (Gao, 1994, 1996;

Li, 2000, 2006; Wu, 2001; Hu & Wang, 2005; Wu & Jia, 2004), *Moss Flora of China* (English version) volumes 1-4, 6-8 (Gao & Crosby, 1999, 2003; Li & Crosby, 2001, 2007; Wu & Crosby, 2002, 2005; Hu *et al.*, 2008) and *Bryoflora of Hengduan Mountains* (Wu, 2000) added many new mosses to Sichuan Province. Also the bryophytes from some famous areas such as Dujiangyan (Jia *et al.*, 2002; He, 2005), Southeast of Chongqing (He, 2005), Mt. Emei (Pei, 2006) etc. in Sichuan have been investigated and reported. According to the literatures concerned until 2010, 1166 species belonging to 302 genera, 59 families of mosses are recorded from Sichuan Province before present research.

Gongga Mountain, the highest peak in Sichuan Province, especially in Hengduan Mountains, is located at 29°20'–30°00' N, 101°30'–102°10' E with altitude from 1 680 m to 7 556 m above sea level (Shen *et al.*, 2004). It is the transition zone between Sichuan Basin and Qinghai-Tibet Plateau, and also an intersection region in a variety of natural elements, with sub-tropical, temperate and frigid zones on the mountain. Mt. Gongga is one of 25 global hot-spot areas of biodiversity conservation in the world. However, no special field survey for bryophytes has been carried out on the Mountain. Only 85 species belonging to 52 genera, 27 families have been recorded in Flora Bryophtorum Sinicorum volumes 1–4, 6–8, Moss Flora of China Volume 1–4, 6–8 and Bryoflora of Hengduan Mts. as well as some ecological studies from the mountain (Yan & Bao, 2008; Zhang, 2007; Guan *et al.*, 1984; Wang, *et al.*, 2007).

In order to better understand the bryoflora of Sichuan Province as well as China, a field investigation for bryophytes was carried out on Mt. Gongga in 2009–2010 and more than 1 000 specimens of mosses were collected from different elevations and habitats. Based on field investigation and identification of the collected specimens, 321 species, 133 genera and 40 families of mosses from Mt. Gongga in Sichuan Province of China are recorded for the first time. (It will be reported in a separate paper). Among them, 12 species belonging to 12 genera, 10 families are new records for Sichuan and reported here in detail. All specimens cited are deposited at Herbarium of Shanghai Normal University (SHNU).

The species new to Sichuan Province are reported in detail as follows:

1 *Dicranodontium porodictyon* Card. et Ther. (Dicranaceae)

The main distinguished characters of this species are: (1) leaves linear-lanceolate, rather abruptly narrowed from an ovate, slightly concave base to a very long, canaliculated and setaceous subula; (2) single cost occupying ca. 1/3 the leaf base width, excurrent in a very long awn; (3) low leaf cells rec-

tangular, thick-walled, porose, becoming narrower and linear toward the margins. This species has been recorded from Guizhou, Hainan, Hunan, Xizang in China (Gao, 1994; Gao & Crosby, 1999).

Specimens examined: Lingshi Lama Temple, alt. 2 790 m, on tree trunks and branches 90832, 90836, T. Cao, ZH Li; Near Jinshan Hotel, alt. 2 900 m, on rocks, 91856, T. Cao, ZH Li; Ganheba, alt. 3 020 m, on rotten wood, 91799, 90360, T. Cao, ZH Li; Changcaoba, alt. 3 600 m, on fallen tree in the running water, 91831, T. Cao, ZH Li; Near Mt. Gongga ropeway station, alt. 3 650 m, on rotten wood, 90190, T. Cao.

2 *Dicranum setifolium* Card. (Dicranaceae)

This species is distinguished by slender plants in dense tufts; leaves lanceolate, with long, channeled, linear acumen; cost slender, occupying ca. 1/7 the leaf base, ending in a short hair-point, smooth at back above; and basal cells elongate, strongly thick-walled and porose. The species was only recorded from Changbai Mountain, Jilin, Northeast China before (Gao, 1994; Gao & Crosby, 1999).

Specimens examined: Caohaizi, alt. 2 870 m, on tree trunks, 90504, T. Cao; Near Jinshan Hotel, alt. 2 900 m, on tree trunks, 90104B, T. Cao.

3 *Campylopus atrovirens* De Not. (Dicranaceae)

This species is characterized by long and slender leaves with hyaline hair-point at tip; single and brownish cost occupying 1/2 the leaf-base width, and elongate-oval cells with thick walls at upper and middle parts of leaf. The species have been reported from Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hunan, Jiangxi, Shaanxi, Xizang, Yunnan, Zhejiang in China (Gao, 1994; Gao & Crosby, 1999).

Specimen examined: Changcaoba; alt. 3 600 m, on fallen tree in the running water, T. Cao, ZH Li, 091832.

4 *Hydrogonium javanicum* (Dozy. et Molk.) Hilp. (Pottiaceae)

This species is distinguished by small plants, 5–10 mm high; ovate-ligulate leaves with obtuse apex; cost stout, percurrent; upper leaf cells irregu-

larly quadrate to hexagonal, thick-walled, mostly smooth. The species has been recorded from Anhui, Hainan, Henan, Jiangsu, Xizang, Yunnan (Gao, 1996; Li & Crosby, 1999).

Specimen examined: Glacier hot spring, alt. 2 600 m, on stream rocks of hot spring, 90825, T. Cao.

5 *Ulotia gymnostoma* S. L. Guo, Enroth & Virtanen (Orthotrichaceae)

Ulotia gymnostoma is a species newly described by Guo *et al.* from Hunan, China in 2004 (Guo *et al.*, 2004). It is distinguished from the other species in genus *Ulotia* mainly by the gymnostomous capsule (capsule without peristome). This species superficially somewhat similar to *Orthotrichum*, but it combines an *Ulotia* gametophyte with a *Macromitrium* sporophyte. The new record of this species from Sichuan confirmed this new species in China.

Specimen examined: Jingliuchang, alt. 1 980 m, on tree trunks, 90848, T. Cao.

6 *Aerobryopsis yunnanensis* X. J. Li et D. C. Zhang (Meteoriaceae)

This species is distinguished by having long, robust plants with irregular branches; leaves broadly ovate lanceolate, with distinct crisped apex and toothed margins; leaf cells short-rhombus, with a central papilla. The species is endemic to China and was described from Yunnan in 2003 by Li et Zhang (Li, 2005; Zhang *et al.*, 2003).

Specimen examined: Village near a bridge, alt. 1 830 m, on sandy soil, 90897, T. Cao.

7 *Hypopterygium formosanum* Nog. (Hypopterygiaceae)

This species is characterized by plants dendroid; lateral leaves elongate-ovate, asymmetric, with shortly acute apices; leaf margins bordered by 1–2 rows of narrowly elongate cells, serrate throughout; amphigastria small, broadly ovate, symmetric, with short acumens. The species has been recorded from Anhui, Jilin, Liaoning, Taiwan (Wu, 2001; Wu & Crosby, 2002).

Specimens examined: Jingliuchang, alt. 1 980 m, on sandy soil, 90903, T. Cao.

8 *Pseudoleskeopsis tosana* Card. (Leskeaceae)

This species is distinguished by primary stems creeping with numerous and short branches in mats; stem leaves broadly lanceolate, gradually tapered to a long acuminate apex; branch leaves ovate to oblong-ovate, acute, usually secund, asymmetric; margins dentate, apical cells projecting and dentate at leaf tips; leaf cells longer, rectangular, smooth, thick-walled. The species has been recorded from Hainan, Shandong, Zhejiang (Wu, 2001; Wu & Crosby, 2002).

Specimen examined: Jingliuchang, alt. 1980 m, on rocks, 90869, T. Cao.

9 *Bryhnia hultenii* Bartr. (Brachytheciaceae)

This species is easily recognized by the leaves broadly ovate, concave, acute or apiculate, often cucullate at apex, decurrent at base; leaf cells short, elongate-rhombic with rounded ends, thin-walled; and alar cells distinctly differentiated, quadrate, thin-walled. The species has been recorded from Heilongjiang, Liaoning, Shaanxi, Xizang, Yunnan (Hu *et al.*, 2005, 2008).

Specimens examined: Near Mt. Gongga rope-way station, alt. 3 080 m, on soil. 90251, T. Cao.

10 *Entodontopsis wightii* (Mitt.) Buck et Ireland (Stereophyllaceae)

This species is characterized by plants rather slender, glossy, often in closely appressed mats; leaves 4-ranked, complanate, oblong-ovate-lanceolate, rather abruptly acute at apex; cost single, reaching ca. 1/2 the leaf length; and alar cells differentiated, consisting of several rows of shortly rectangular cells. The species has been recorded from Yunnan (Hu *et al.*, 2005, 2008).

Specimen examined: Jingliuchang, alt. 1 980 m, on tree branches, 90862, T. Cao.

11 *Hypnum recurvatum* (Lindb. et Arn.) Kindb. (Hypnaceae)

This species is characterized by stem leaves ovate-lanceolate to oblong-lanceolate, falcate-se-cund, concave, slenderly acuminate, with recurved margins below; cost double, weak or absent; alar cells differentiated, subquadrate, thin-walled; and

pseudoparaphylla often present, linear or filamentous. The species has been recorded from Shaanxi, Xizang, Yunnan (Wu & Jia, 2004; Wu & Crosby, 2005).

Specimen examined: Mt. Gongga ropeway station, alt. 3 083 m, on tree trunks, 90257, T. Cao.

12 *Macrothamnium javense* Fleisch. (Hylocomiaceae)

This species is distinguished by robust, dendroid plants; stem leaves cordate at base, semi-ovate, broadly acute or obtuse; margins sharply toothed above; cost distinctly double; branch leaves ovate to oblong-ovate, broadly acute. The species has been recorded from Xizang, Yunnan (Wu & Jia, 2004; Wu & Crosby, 2005).

Specimens examined: Caohaizi, alt. 2 870 m, on tree trunks, 31078, 31079, T. Cao, ZH Li.

Acknowledgements We appreciated Institute of Mountain Hazards and Environment, Chinese Academy of Sciences, Chengdu for help and support during our field work in Gongga Mountain in 2009–2010. Thanks are due to Prof. Gao Chien, Institute of Applied Ecology, Chinese Academy of Sciences, Shenyang and Dr. Guo Shui-liang, Shanghai Normal University for their identification of some specimens.
